Назаров Рустам M3432 Лаб-3

11 марта 2026 г.

1 Лабораторная работа 3 — Сегментация дорожных знаков и трекинг

Цель: Обучить модель сегментации на наборе Russian road signs (sign_dataset), оценить метрики на валидации и на отснятых видео, запустить два алгоритма трекинга и посчитать ID Switches.

[1]:
```
# Установка зависимостей (выполнить один раз в терминале или раскомментировать␣
↪ниже)
# !pip install ultralytics opencv-python pycocotools scipy tqdm
# На Mac (Apple Silicon) PyTorch автоматически использует MPS (Metal GPU) -␣
↪обучение и инференс ускорятся.

# Для раздела с видео: создайте папку videos/ и положите туда 3+ видео по 30+␣
↪сек (около ИТМО или в узнаваемых местах).
```

1.1 1. Подготовка данных: конвертация sign_dataset (VIA) в COCO и загрузка

Путь к данным: `sign_dataset/train`, `sign_dataset/val` с файлами `via_region_data.json`.

[2]:
```
import os
import json
import numpy as np
from PIL import Image

```

1.8 Итоговые выводы по работе

- **Сегментация на sign_dataset.** Модель YOLO-seg (вариант `yolo11s-seg`) была дообучена на датасете дорожных знаков. Несколько факторов ухудшения: (1) использовалась относительно лёгкая модель без сложной FPN-архитектуры, (2) ограниченное число эпох дообучения, (3) очень маленькие и тонкие объекты (знаки), чувствительные к смещению маски на пару пикселей, (4) шум и артефакты в данных (битые JPEG'и, неточная разметка). В итоге модель уверенно находит знак как объект, но точность границ масок проседает, что сильно бьёт по IoU.

- **Поведение на видео.** На трёх собственных видео модель демонстрирует: на первом видео в среднем почти один знак на кадр, на втором и третьем — около 0.3–0.5 знака на кадр. Это соответствует содержанию роликов (первое видео богаче на знаки, второе и третье более пустые). Визуальный просмотр сохранённых кадров с масками показыва-

ет, что крупные и хорошо видимые знаки сегментируются стабильно, а основная часть ошибок связана с мелкими или частично перекрытыми экземплярами.

- **Трекинг и ID Switches.** Для всех трёх видео посчитаны ID Switches для двух трекеров — ByteTrack и BoT-SORT. ByteTrack на всех видео дал 0 ID Switches, BoT-SORT на двух видео тоже 0, а на одном видео 2 ID Switches. При этом среднее число детектированных объектов на кадр у трекеров очень близко. Такая картина правдоподобна: сцены простые (немного объектов, редкие перекрытия, плавная камера), поэтому трекеры почти не путают идентификаторы, а редкие switch'и у BoT-SORT на третьем видео можно интерпретировать как моменты переобнаружения объекта после краткой пропажи или перекрытия.

- **Общее понимание.** В ходе работы был реализован полный пайплайн: конвертация VIA→COCO→YOLO, обучение YOLO-seg, расчёт метрик IoU/Precision/Recall/L2 и долей кадров с IoU 0.5/0.75/0.9, а также запуск двух трекеров с подсчётом ID Switches и наглядной визуализацией. Основной вывод: YOLO-seg как более лёгкая и быстрая архитектура ожидаемо уступает Mask R-CNN по точным численным метрикам на сложном датасете мелких объектов, но при этом обеспечивает достаточно стабильное детектирование и трекинг дорожных знаков на реальных видео; разница между ByteTrack и BoT-SORT по ID Switches на выбранных сценах невелика и хорошо интерпретируема.
